Suture Suspension

Suture Suspension featuring the Serdev Technique

The Traditional Lift Replacement

The Serdev Technique for lifts has in many cases replaced traditional lifts. **The procedures are done without putting our patients to sleep and the results will last for years.**

Face lift – Replace a sad face with a happy face. Receive a younger and more natural appearance.

Buttocks lift – Narrow the buttocks. Give the appearance of more volume and lift at the same time. Elongate the look of the legs.

Eyebrow lift – Lift sagging forehead skin.

What is Suture Suspension?

Suture Suspension is the procedure that lifts loose skin or flabby soft issue.

Traditional lifts required a surgeon to make large, dramatic incisions, but by using several small incisions and long internal sutures, we can now contour and shape the face and body without resorting to invasive and complex surgery.

The technique is used for the **scarless** lifting of the face and buttocks.

- Awake and under local numbing! European method offered exclusively at SW Liposculpture and Anti-Aging Center!

What is The Serdev Technique?

Before & After Photos

The Serdev Technique lifts the deep moveable subcutaneous tissue by anchoring it to non-moveable fibrous tissue. Employing this technique results in a more natural and youthful appearance. The Serdev Technique is ideal for lifting the face, chin, eyebrow, buttocks and abdomen.

This technique is much better than typical forms of suture suspension, which are more superficial and do not last as long. The names that these superficial forms of suture suspension will often appear under are "Curl Lift", "Coffee Break Lift", "Contour Thread Lift", and "Feather Lift". Again, these approaches yield results that do not last as long as procedures done using the Serdev Technique.

Suture Suspension Benefits

Key Benefits of Suture Suspension are significant:

- No scarring
- No general anesthesia
- A natural look
